Fullstack engineer with 12+ years of experience, 8 of them building and owning core systems in a large enterprise TypeScript/React product. Deep frontend background, increasingly focused on LLM-powered applications — including evaluation architectures that catch model hallucinations through symbolic verification.

SKILLS

Languages TypeScript, JavaScript, Python, Go, Java, Bash, C, SQL

Frontend React, Node.js, HTML/CSS, Dojo, AngularJS

AI / LLM LLM application design, evaluation harnesses, local model deployment (llama.cpp, Ollama), fine-tuning, prompt engineering, MCP

Infrastructure Docker, Linux, AWS, Git

EXPERIENCE

Fullstack Developer — Centric Software

June 2018 – Present · Bay Area, CA

- Founded and led the Canvas team after inheriting an undocumented, unstable third-party codebase. Refactored it into a maintainable, extensible framework and onboarded 3 junior developers onto it.
- Diagnosed a 3+ minute canvas save affecting 200+ enterprise customers as thumbnail generation blocking the save path; moved it to asynchronous background generation with completion callbacks, cutting saves to ~10 seconds.
- Own the charts system and number localization end-to-end — from data layer through rendering — across a product serving hundreds of enterprise customers.
- On the Core Frameworks team, modified foundational systems used product-wide: the query system, data models, and core widget rendering relied on by hundreds of customer configurations.
- On the First Responders team, diagnosed and resolved production issues under time pressure, tracing bugs to root causes across unfamiliar code rather than patching symptoms.
- Adopted AI-assisted development early and at scale (Claude Code, Cursor), developing practical judgment about where model-generated code is reliable and where it introduces regressions.

Frontend Engineer — 2nfro

April 2013 – Oct 2017

- Built the frontend for a social network aggregator end-to-end, covering UI/UX for both web and mobile.
- Solved cross-cutting technical problems independently in a small startup environment, including iOS browser compliance issues and lazy-loading performance work.

PROJECTS

Anki MCP Server *(Python, 2026)*
Model Context Protocol server that turns Japanese visual-novel screenshots into triaged flashcards, checking each candidate against the existing collection to skip duplicates. Designed read-only — every mutation routes through a local approval UI requiring explicit per-card confirmation. Versioned card formats let stale cards resurface for regeneration.

LLM Evaluation Architecture for Chess Analysis *(2026)*
Designed a claim-decomposition and symbolic-verification system to catch LLM hallucinations about game state: model output is decomposed into discrete factual claims, each verified programmatically against engine ground truth before reaching the user. Built with python-chess and Stockfish.

Japanese Reading Assistant *(2026)*
Browser extension for reading Japanese web fiction, with series-level glossary management and Anki integration for spaced-repetition export. Source-agnostic parsing layer designed to support multiple content formats.

EDUCATION

Carnegie Mellon University — BS in Mathematics, 2009–2013

Other — Competed internationally in Super Smash Bros. Melee (as “Laudandus”); 5th at Pound 2016, 7th at DreamHack Austin 2017.
